

Uro-Gard™ as a Solution in the Covid-19 Healthcare Landscape

Physical Safety | Peace of Mind | Financial Relief

With a major effort being placed on limiting exposure and contact between patients and caregivers, solutions to support this are more important now than ever before.

- The Uro-Gard is specifically designed for dryness and extended-wear (16-24 hours), automatically requiring less checking and changing. Use of the Uro-Gard compared to diapers and catheters is expected to reduce the number of nurse-patient interactions from 10+ per day to 4 or fewer.
- Additionally, the Uro-Gard is designed for more freedom, mobility and autonomy, so patients can do more on their own.
- Patients and caregivers will be protected through:
 - Social distancing
 - Limited interactions
 - Less exposure
 - Fewer opportunities for infection
 - Savings in a strained economy

For these reasons and more, the Uro-Gard has the potential to be a major solution among Covid-19 precautions and protocols, supporting prevention and safe recovery.

Moreover, these important benefits are expected to last far beyond the Covid-19 crisis and continue to bring a wide range of advantages to hospitals and health care facilities long-term.
